I. Introduction. Renal function declines with age as a result of the anatomical and physiological changes that occur with aging. Because renal function deteriorates with age, even in the seemingly healthy patient, clearance of renally excreted and metabolized drugs may be markedly impaired in the elderly patient.

Incidence of stroke attributable to atrial fibrillation increases from 1.5% at age 50â€“59 years to 23.5% at age 80â€“89 years. The use of oral anticoagulants to reduce the risk of stroke is well established, but all the available agents can cause bleeds if used in excess dose, in high-risk patients or in patients with reduced kidney function.
