1. INTRODUCTION - A transistor is a small electronic device that can cause changes in a large electrical output signal by small changes in a small input signal. That is, a weak input signal can be amplified (made stronger) by a transistor. For example, very weak radio signals in the air can be picked up by a wire antenna and processed by transistor amplifiers until they are strong enough to be ...

A transistor is a semiconductor device used to amplify or switch electronic signals and electrical power. It is composed of semiconductor material usually with at least three terminals for connection to an external circuit. A voltage or current applied to one pair of the transistor's terminals controls the current through another pair of terminals. Because the controlled (output) power can be ...

A bipolar junction transistor (bipolar transistor or BJT) is a type of transistor that uses both electron and hole charge carriers. In contrast, unipolar transistors, such as field-effect transistors, only use one kind of charge carrier. For their operation, BJTs use two junctions between two semiconductor types, n-type and p-type.. BJTs are manufactured in two types, NPN and PNP, and are ...

1. Intake stroke: draws air and fuel from the intake manifold, past the open intake valve, and into the cylinder.. The amount of fuel going into the engine must be based on the amount of air going into the engine so the mixture is appropriate for the conditions.

VFC32 6 PRINCIPLES OF OPERATION The VFC32 operates on a principle of charge balance. The signal input current is equal to V_{IN}/R_1 . This current is integrated by input op amp and C2, producing a downward ramping integrator output voltage.
