In physics, the wavelength is the spatial period of a periodic wave—the distance over which the wave's shape repeats. It is thus the inverse of the spatial frequency. Wavelength is usually determined by considering the distance between consecutive corresponding points of the same phase, such as crests, troughs, or zero crossings and is a characteristic of both traveling waves and standing ...

### **Wavelength - Wikipedia**

The wavelength is changing with the changing of the temperature, because the speed of sound changes with the temperature.

For a tube of length with one end closed and the other end open the wavelength of the fundamental harmonic is  $\lambda$ , as indicated by the first two animations. Hence,  $f = \frac{v}{\lambda}$ . Therefore, using the relation  $f = \frac{v}{\lambda}$ , where  $v$  is the speed of the wave, we can find the fundamental frequency in terms of the speed of the wave and the length of the tube:  $f = \frac{v}{\lambda}$ .

4 Speed of sound describes the speed at which sound waves move through matter. However, this changes based on the type of matter, and many other factors.

Amplitude Definition: 1.The maximum extent of a vibration or displacement of a sinusoidal (!) oscillation, measured from the position of equilibrium. Amplitude is the maximum absolute value of a periodically varying quantity. 2.The maximum difference of an alternating electrical current or potential from the average value.
